

WINTER- 12 EXAMINATION

Subject Code: 12001

Model Answer

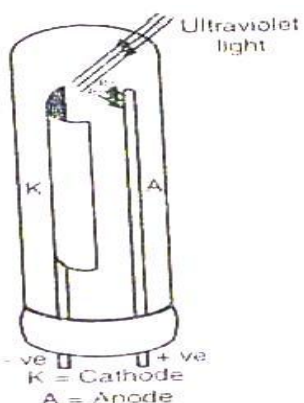

Page No: 1/24

Que. No.	Sub. Que.	Stepwise Solution	Marks	Total Marks
1)	1)	Fundamental quantity Derived quantity Fundamental quantity: - Length, Time, Mass, Luminous intensity. Derived quantity:-Force, Acceleration, volume, Pressure, Work.	1 1	2
	2)	Each Definition Factor of Safety: It is the ratio of ultimate stress to working stress. OR It is the ratio of maximum load that the structure can bear to the actual load on the structure. Elastic limit:- Elastic limit is defined as the maximum stress corresponding to the limiting value of the load which when applied & then removed does not produce any permanent deformation in a body. OR The maximum value of stress up to which the body shows elastic behavior is called the elastic limit.	1	2
	3)	Each Definition Cohesive Force It is the force of attraction between two molecules of same substance. OR The molecules of liquid exert force of attraction on one another called cohesive force. Adhesive Force It is the force of attraction between two molecules of different substance.	1	2
	4)	Formula Meaning Formula of critical velocity is given as $V_c = \frac{\eta R}{\rho r}$ Where, V_c -Critical Velocity of flow of liquid. ρ - Density of the liquid r – Radius of the tube. η – Coefficient of viscosity of liquid. R - Reynolds number.	1 1	2

Que. No.	Sub. Que.	Stepwise Solution	Marks	Total Marks
	5)	Reason 1) We know that, the material which does not allow the passage of heat from it is called as Bad Conductor. 2) Since, glass is a bad conductor of heat, the vacuum between the walls acts as an insulator. 3) Therefore, the thermos flask consists of doubled walled glass vessel with vacuum between walls.	2	2
	6)	Reason In case of C_v the supplied heat is used only to increase the temperature of gas by 1°C In case of C_p the supplied heat is used i) to increase the temperature by 1°C ii) to increase the volume of gas at constant pressure Therefore additional amount of heat is required for doing the work at constant pressure. Therefore specific heat at constant pressure (C_p) is greater than specific heat at constant volume (C_v)	2	2
	7)	Definition Resonance: - If the frequency is forced upon a body and if the forced frequency matches (is equal to) the natural frequency of the body, the body vibrates with large amplitude. This phenomenon is called as resonance. OR It is also defined as a phenomenon in which a body vibrates with large amplitude due to the effect of a forced frequency which is equal to natural frequency of the body.	2	2

	11)	<p>Formula</p> <p>Ans with unit</p> <p>Given:</p> <p>$\gamma = 30 \times 10^{-6} / ^\circ\text{K}$</p> <p>$\beta = ?$</p> <p>We have,</p> $\alpha : \beta : \gamma = 1 : 2 : 3$ $\frac{\beta}{\gamma} = \frac{2}{3}$ $\therefore \beta = \frac{2\gamma}{3}$ $\beta = \frac{2 \times (30 \times 10^{-6})}{3}$ $\beta = 20 \times 10^{-6} / ^\circ\text{K}$	1 1	2
	12)	<p>Formula</p> <p>Ans with unit</p> <p>Given:</p> <p>$n = 91.1 \text{ KHz} = 91.1 \times 10^3 \text{ Hz}$</p> <p>$v = 3 \times 10^8 \text{ m/s}$</p> <p>$\lambda = ?$</p> <p>Formula: $v = n \lambda$</p> $\lambda = \frac{v}{n}$ $= \frac{3 \times 10^8}{91.1 \times 10^3}$ $= 0.0329 \times 10^5 \text{ m}$	1 1	2

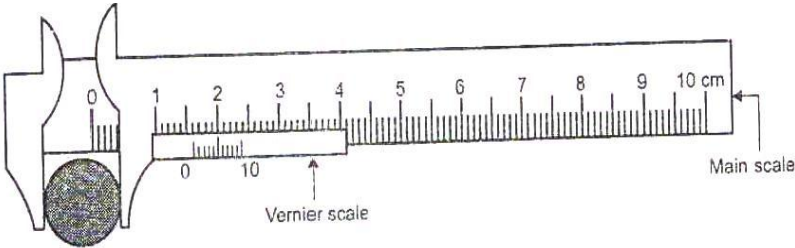

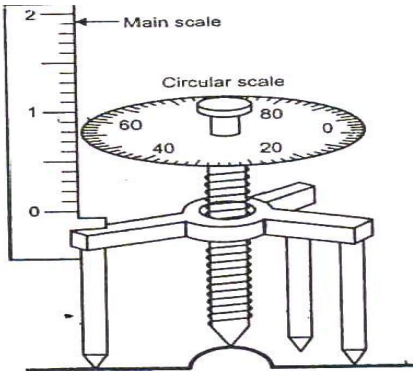

Model Answer

Que. No.	Sub. Que.	Stepwise Solution	Marks	Total Marks
2	1)	<p>Least Count(LC) = Pitch/Total number of divisions on circular scale.</p> <p>No zero error: Zero of axial line is coinciding with zero of circular scale</p>  <p style="text-align: center;">(a)</p> <p>Zero error = No error and Zero correction (z) = 0</p> <p>Positive zero error: Zero of circular scale is below the axial line</p>  <p style="text-align: center;">(b)</p> <p>2nd division of circular scale coincide with axial line Zero error = + (2 X LC) and Zero correction (z) = - (2 X LC)</p> <p>Negative zero error: Zero of circular scale is above the axial line</p>  <p style="text-align: center;">(c)</p> <p>96th division of circular scale coincide with axial line Zero error = - [(n-96) X LC] and Zero correction (z) = + [(n-96) X LC]</p>	1 1 1 1	4
	2)	<p>Definition</p> <p>Range</p> <p>Least Count</p> <p>Reading</p> <p>Error:</p> <p>An error is fault, which may occur even in the most careful observation</p> <p>OR</p> <p>The error is a deviation of measurement from standard value.</p> <p>Range: 0 - 5V</p> <p>Least Count : 0.1 V</p> <p>Reading: 2.8 V</p>	1 1 1 1	4

Que. No.	Sub. Que.	Stepwise Solution	Marks	Total Marks
	3)	<p>Neat labeled diagram</p> <p>Explanation</p>  <p>E = Elastic limit Y = Yield point B = Breaking point S = Set point D = Ultimate stress</p> <p>A graph or diagram of stress and strain is shown as above.</p> <p>OE Portion is straight line which indicates that stress is proportional to strain. Therefore the wire obeys Hooke's law upto the point E this point is called elastic limit.</p> <p>EE' Portion is curved towards strain axis this shows that increase in strain is more, than increase in stress. In this region stress is not proportional to strain. Between any point E and E' if all load is removed then some permanent elongation/ Expansion / increase in length takes place in the wire this is called set. When wire is again loaded, a new straight line SE' is obtained which obey Hooke's law.</p> <p>Some portion after the point Y is almost parallel to strain axis this shows that strain increases without increase in stress just like wire flows. This is called plastic flow. The point at which the plastic flow begins is called yield point.</p> <p>During the plastic flow the wire becomes thin and thin. Some weak points called neck are formed in the wire. At weakest point (neck), wire breaks.</p> <p>The maximum stress upto which wire can be loaded or wire can bear is called breaking stress. Point B is breaking point.</p> <p>Before point B the point D is ultimate stress point. It is the max. stress the wire is capable of with standing.</p>	1 3	4
	4)	<p>Formula</p> <p>Substitution</p> <p>Ans with unit</p> <p>Given:</p> <p>$d = 3\text{mm}$, radius (r) = $1.5\text{mm} = 1.5 \times 10^{-3} \text{ m}$</p> <p>$L = 4 \text{ m}$</p> <p>$l = 2.5 \times 10^{-3} \text{ m}$</p> <p>$F = 10 \text{ N}$</p> <p>$Y = ?$</p>	1 1 2	4

Que. No.	Sub. Que.	Stepwise Solution	Marks	Total Marks
2)	4)	<p>Formula:</p> $Y = \frac{FL}{Al} = \frac{FL}{\pi r^2 l}$ $Y = \frac{10 \times 4}{3.14 \times (1.5 \times 10^{-3})^2 \times 2.5 \times 10^{-3}}$ $Y = 2.26 \times 10^9 \frac{N}{m^2}$		
	5)	<p>Diagram</p> <p>Explanation Laplace's molecular theory of surface tension</p> <ol style="list-style-type: none"> 1. Consider three molecules A, B & C of the liquid. A sphere of influence is drawn as shown in fig. 2. The sphere of influence of molecule 'A' is completely inside the liquid, so it is equally attracted in all directions by the other molecules lying within its sphere. Hence the resultant force acting on it is zero. 3. The part of the sphere of influence of molecule 'B' lies outside the liquid & the major part lie inside the liquid. Therefore resultant force acting on it is directed downward. 4. For Molecule 'C' half of its sphere of influence lies inside the liquid and half lies outside the liquid. So, the maximum resultant downward force is acting on molecule 'C'.  <p>Fig: Laplace molecular theory</p>	1½ 2½	4

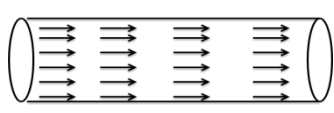

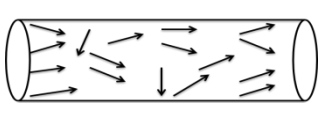

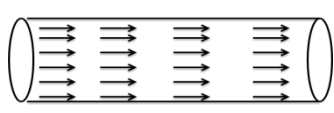

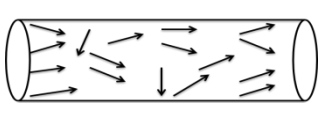

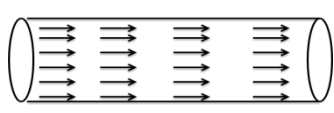

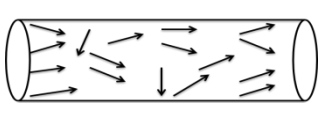

Que. No.	Sub. Que.	Stepwise Solution	Marks	Total Marks
		<p>5. Thus molecule A experiences zero resultant force, B experience downward resultant force, C experience more downward resultant force. In short molecules below imaginary line PQ experience zero resultant force and molecules about line PQ experience some or more downward resultant force.</p> <p>6. Thus molecules which lie on the surface of liquid (surface film) experience downward resultant force and are being pulled inside the liquid. To balance this downward force, molecules come closer to each other. This reduces the surface area of liquid.</p> <p>7. This gives rise to surface tension. It is the contraction force which decreases the surface area of the liquid.</p>		
6)		<p>Each neat labeled diagram</p> <p>Vernier Caliper:</p>  <p>Spherometer:</p>  <p>OR any other relevant diagram</p>	2	4

Que. No.	Sub. Que.	Stepwise Solution	Marks	Total Marks
3	1)	Each Definition Stress: Stress is defined as the restoring force per unit cross-sectional area of a body. Strain: Strain is defined as the change in dimension per unit original dimension of a body. Restoring Force: The force which is developed in a body in ordered to regain its original size and shape after removal of external force is called restoring force. Deforming Force: It is an external force which changes the shape or size of the body after its applications.	1	4
	2)	Reason The free surface of liquids has property called surface tension. According to Laplace's molecular theory of surface tension the molecules which lie on the surface of liquid (surface film) experience downward resultant force and are being pulled inside the liquid. To balance this downward force, molecules come closer to each other. Therefore free surface of liquid behaves like a stretched elastic membrane. This reduces the surface area of liquid. Since spherical shape is the only shape which has minimum surface area, therefore the shape of liquid drop is spherical in nature.	4	4
	3)	Formula Substitution Ans with unit Given: $h_1 = 2\text{cm} = 2 \times 10^{-2} \text{ m}$ diameter 1 = 2.6 mm; radius, $r_1 = 1.3\text{mm} = 1.3 \times 10^{-3} \text{ m}$ diameter 2 = 2 mm; radius, $r_2 = 1\text{mm} = 1 \times 10^{-3} \text{ m}$ $h_2 = ?$	1 1 2	4

Que. No.	Sub. Que.	Stepwise Solution	Marks	Total Marks																
3	3)	Formula: $h_1 r_1 = h_2 r_2$ $\therefore h_2 = \frac{r_1 h_1}{r_2}$ $h_2 = \frac{1.3 \times 10^{-3} \times 2 \times 10^{-2}}{1 \times 10^{-3}}$ $h_2 = 2.6 \times 10^{-2} m$																		
	4)	<p>Any 4 points</p> <table><tr><th>Stream line flow</th><th>Turbulent flow</th></tr><tr><td>The path of every particle is same</td><td>The path of every particle is different</td></tr><tr><td>The velocity of particle is constant in magnitude and direction</td><td>The velocity of particle at each point is not constant</td></tr><tr><td>Flow is regular</td><td>Flow is irregular</td></tr><tr><td>No circular currents or eddies are developed</td><td>Random circular currents called vortices are developed</td></tr><tr><td>The liquid flow is streamline upto critical velocity.</td><td>The flow becomes turbulent after critical velocity.</td></tr><tr><td>Eq. - The flow of liquid through pipe</td><td>Eq.- Water fall</td></tr><tr><td></td><td></td></tr></table>	Stream line flow	Turbulent flow	The path of every particle is same	The path of every particle is different	The velocity of particle is constant in magnitude and direction	The velocity of particle at each point is not constant	Flow is regular	Flow is irregular	No circular currents or eddies are developed	Random circular currents called vortices are developed	The liquid flow is streamline upto critical velocity.	The flow becomes turbulent after critical velocity.	Eq. - The flow of liquid through pipe	Eq.- Water fall			4	4
Stream line flow	Turbulent flow																			
The path of every particle is same	The path of every particle is different																			
The velocity of particle is constant in magnitude and direction	The velocity of particle at each point is not constant																			
Flow is regular	Flow is irregular																			
No circular currents or eddies are developed	Random circular currents called vortices are developed																			
The liquid flow is streamline upto critical velocity.	The flow becomes turbulent after critical velocity.																			
Eq. - The flow of liquid through pipe	Eq.- Water fall																			
																				
	5)	<p>Formula Substitution Ans with unit Given: Diameter = 3mm \therefore Radius ,r = 1.5 X 10⁻³ m d =7.8 X 10³ kg/m³ ρ=1.2 X 10³ kg/m³ v = 0.231 m/s η =?</p>	1 1 2	4

6	3)	<p>Diagram Principle Working Diagram:</p>  <p> T - Target F - Metal filament S - Cylinder A - Ammeter B - Battery Rh - Rheostat P₁ P₂ - Primary of transformer S₁, S₂ - Secondary of transformer </p> <p>Principle: When fast moving electrons are suddenly stopped then X-rays are produced.</p> <p>Working: When the cathode is heated by electric current it produced electron due to thermionic emissions. The beam of electron is then focused on the anode (target). The electrons from cathode are accelerated by applying of high voltage between cathode & anode using step up transformer. When these fast moving electrons are suddenly stopped by tungsten anode, they lose their kinetic energy and x rays are produced from the target. Some amount of Kinetic energy is converted to large amount of heat. By controlling the filament current, the thermionic emission of electron hence intensity of X- rays can be controlled.</p>	2 1 1	4

6	4)	<p>Any Four uses</p> <p>Uses Of X-rays:</p> <ol style="list-style-type: none">1. X- rays are used to detect the cracks in the body of aero plane or motor car2. X- rays are used to detect the manufacturing defects in rubber tyres or tennis ball in quality control3. X - rays are used to detect flows or cracks in metal jobs.4. X- rays are used to distinguish real diamond from duplicate one5. X- rays are used to detect smuggling gold at airport and docks (ship) yard.6. X-rays are used to detect cracks in the wall7. X- ray radiography is used to check the quality of welded joints.8. X - Rays are used in surgery to detect bone fracture.9. X- Rays are used to cure skin diseases and destroy tumours.10. X - Rays are used to cure diseases like cancer11. X - Rays are used to detect bullets position inside the body. <p>(Any relevant uses to be considered)</p>	1 for each	4

6	5)	<p>Construction Diagram Working</p> <p>Construction:</p> <p>It consists of cathode (K) & anode (A) enclosed in an evacuated glass bulb. Semi-cylindrical cathode coated with photosensitive material from inner side. Anode is a rod of platinum kept along the axis of cathode. Cathode is connected to the negative terminal & anode is connected to the positive terminal of high tension battery through milliammeter.</p> <p>Diagram:</p>  <p>Working:</p> <p>When light is allowed to fall on cathode it emits photoelectrons. These photoelectrons are attracted by anode. The photoelectric current flows through the circuit & milliammeter shows the deflection.</p>	2 1 1	4
