

Instructions: (1) All questions are compulsory. (2) Illustrate your answers with neat sketches wherever necessary. (3) Figures to the right indicate full marks. (4) Assume suitable data, if necessary. Mark 1. Attempt any ten of the following: a) Define: i) Normality ii) Molarity. b) Name any two chemical industries. c) Differentiate between sedimentation and filtration (any two points). d) State Rittinger's law. e) Give one chemical reaction each of the following unit processes. i) Oxidation ii) Reduction. f) Give flow sheet symbol for inflow line and outflow line. g) Define: i) Vapour pressure ii) Boiling point of liquid. h) Convert following °C values to of i) 100°C ii) 32°C. i) Give the values of normal atmospheric pressure in atm and in kPa. j) Define: i) Pefine: i) Partial pressure ii) Pure component volume. k) None any two oxidising agents. l) Define: i) Density ii) Specific gravity of liquid. m) Define the term pyrolysis.	3 H	ours / 100 M	[arks	Seat No.								
a) Define: i) Normality ii) Molarity. b) Name any two chemical industries. c) Differentiate between sedimentation and filtration (any two points). d) State Rittinger's law. e) Give one chemical reaction each of the following unit processes. i) Oxidation ii) Reduction. f) Give flow sheet symbol for inflow line and outflow line. g) Define: i) Vapour pressure ii) Boiling point of liquid. h) Convert following °C values to of i) 100°C ii) 32°C. i) Give the values of normal atmospheric pressure in atm and in kPa. j) Define: i) Partial pressure ii) Pure component volume. k) None any two oxidising agents. l) Define: i) Density ii) Specific gravity of liquid.		Instructions :	(2) Illustra(3) Figures	te your answei to the right ir	rs with idicat	h neat e full	mark		hereve	e r nec	essary	·.
a) Define: i) Normality ii) Molarity. b) Name any two chemical industries. c) Differentiate between sedimentation and filtration (any two points). d) State Rittinger's law. e) Give one chemical reaction each of the following unit processes. i) Oxidation ii) Reduction. f) Give flow sheet symbol for inflow line and outflow line. g) Define: i) Vapour pressure ii) Boiling point of liquid. h) Convert following °C values to of i) 100 °C ii) 32 °C. i) Give the values of normal atmospheric pressure in atm and in kPa. j) Define: i) Partial pressure ii) Pure component volume. k) None any two oxidising agents. l) Define: i) Density ii) Specific gravity of liquid.  i) Normality ii) Molarity. b) Name any two chemical industries. c) Differentiate between sedimentation and filtration (any two points). d) State Rittinger's law. e) Give one chemical reaction each of the following unit processes. i) Oxidation ii) Reduction. f) Give flow sheet symbol for inflow line and outflow line. g) Define: i) Vapour pressure ii) Boiling point of liquid. h) Convert following °C values to of i) 100 °C ii) 32 °C. i) Give the values of normal atmospheric pressure in atm and in kPa. j) Define: i) Partial pressure ii) Pure component volume. k) None any two oxidising agents. l) Define: i) Density ii) Specific gravity of liquid. 	1. At	ttempt any ten of the	following:									20
 b) Name any two chemical industries. c) Differentiate between sedimentation and filtration (any two points). d) State Rittinger's law. e) Give one chemical reaction each of the following unit processes. i) Oxidation ii) Reduction. f) Give flow sheet symbol for inflow line and outflow line. g) Define: i) Vapour pressure ii) Boiling point of liquid. h) Convert following °C values to of i) 100°C ii) 32°C. i) Give the values of normal atmospheric pressure in atm and in kPa. j) Define: i) Partial pressure ii) Pure component volume. k) None any two oxidising agents. l) Define: i) Density ii) Specific gravity of liquid. 	a)	Define:										
c) Differentiate between sedimentation and filtration (any two points). d) State Rittinger's law. e) Give one chemical reaction each of the following unit processes. i) Oxidation ii) Reduction. f) Give flow sheet symbol for inflow line and outflow line. g) Define: i) Vapour pressure ii) Boiling point of liquid. h) Convert following °C values to of i) 100°C ii) 32°C. i) Give the values of normal atmospheric pressure in atm and in kPa. j) Define: i) Partial pressure ii) Pure component volume. k) None any two oxidising agents. l) Define: i) Density ii) Specific gravity of liquid.		i) Normality	ii) Molari	ty.								
d) State Rittinger's law. e) Give one chemical reaction each of the following unit processes. i) Oxidation ii) Reduction. f) Give flow sheet symbol for inflow line and outflow line. g) Define: i) Vapour pressure ii) Boiling point of liquid. h) Convert following °C values to of i) 100°C ii) 32°C. i) Give the values of normal atmospheric pressure in atm and in kPa. j) Define: i) Partial pressure ii) Pure component volume. k) None any two oxidising agents. l) Define: i) Define: i) Density ii) Specific gravity of liquid.	b)	Name any two cher	nical industrie	es.								
e) Give one chemical reaction each of the following unit processes. i) Oxidation ii) Reduction. f) Give flow sheet symbol for inflow line and outflow line. g) Define: i) Vapour pressure ii) Boiling point of liquid. h) Convert following °C values to of i) 100°C ii) 32°C. i) Give the values of normal atmospheric pressure in atm and in kPa. j) Define: i) Partial pressure ii) Pure component volume. k) None any two oxidising agents. l) Define: i) Density ii) Specific gravity of liquid.	c)	Differentiate between	en sedimentati	ion and filtration	n (any	two po	oints).					
 i) Oxidation ii) Reduction. f) Give flow sheet symbol for inflow line and outflow line. g) Define: i) Vapour pressure ii) Boiling point of liquid. h) Convert following °C values to of i) 100°C ii) 32°C. i) Give the values of normal atmospheric pressure in atm and in kPa. j) Define: i) Partial pressure ii) Pure component volume. k) None any two oxidising agents. l) Define: i) Define: ii) Specific gravity of liquid. 	d)	State Rittinger's law.										
 f) Give flow sheet symbol for inflow line and outflow line. g) Define: i) Vapour pressure ii) Boiling point of liquid. h) Convert following °C values to of i) 100°C ii) 32°C. i) Give the values of normal atmospheric pressure in atm and in kPa. j) Define: i) Partial pressure ii) Pure component volume. k) None any two oxidising agents. l) Define: i) Density ii) Specific gravity of liquid. 	e) Give one chemical reaction each of the following unit processes.											
g) Define: i) Vapour pressure ii) Boiling point of liquid. h) Convert following °C values to of i) 100°C ii) 32°C. i) Give the values of normal atmospheric pressure in atm and in kPa. j) Define: i) Partial pressure ii) Pure component volume. k) None any two oxidising agents. l) Define: i) Density ii) Specific gravity of liquid.		i) Oxidation	ii) Reduct	tion.								
 i) Vapour pressure ii) Boiling point of liquid. h) Convert following °C values to of i) 100°C ii) 32°C. i) Give the values of normal atmospheric pressure in atm and in kPa. j) Define: i) Partial pressure ii) Pure component volume. k) None any two oxidising agents. l) Define: i) Density ii) Specific gravity of liquid. 	f	Give flow sheet syn	nbol for inflow	line and outflov	w line.							
h) Convert following °C values to of i) 100°C ii) 32°C. i) Give the values of normal atmospheric pressure in atm and in kPa. j) Define: i) Partial pressure ii) Pure component volume. k) None any two oxidising agents. l) Define: i) Density ii) Specific gravity of liquid.	g)	Define:										
 i) 100°C ii) 32°C. i) Give the values of normal atmospheric pressure in atm and in kPa. j) Define: i) Partial pressure ii) Pure component volume. k) None any two oxidising agents. l) Define: i) Density ii) Specific gravity of liquid. 		i) Vapour pressur	e ii) Boiling	g point of liquid.								
 i) Give the values of normal atmospheric pressure in atm and in kPa. j) Define: i) Partial pressure ii) Pure component volume. k) None any two oxidising agents. l) Define: i) Density ii) Specific gravity of liquid. 	h)	_		f								
 j) Define: i) Partial pressure ii) Pure component volume. k) None any two oxidising agents. l) Define: i) Density ii) Specific gravity of liquid. 		i) 100°C	ii) 32°C.									
 i) Partial pressure ii) Pure component volume. k) None any two oxidising agents. l) Define: i) Density ii) Specific gravity of liquid. 	i)	Give the values of i	normal atmosp	oheric pressure i	in atm	and in	kPa.					
k) None any two oxidising agents.l) Define:i) Densityii) Specific gravity of liquid.	j											
l) Define:i) Densityii) Specific gravity of liquid.		•		omponent volur	ne.							
i) Density ii) Specific gravity of liquid.	k)	•	ising agents.									
	Ŋ		a		• 1							
		•		ic gravity of liqu	11 a .							

Marks	M	ar	ks
-------	---	----	----

2.	Attempt any	f our of the	following
----	-------------	---------------------	-----------

16

- a) Draw the symbols of
 - i) Jaw crusher
 - ii) Rotary dryer
 - iii) Packed column
 - iv) Centrifugal pump.
- b) Write the uses of nitric acid (any four).
- c) Explain chlorination reaction of methane.
- d) How many moles of H₂SO₄ will contain 64 kg of S?
- e) Describe the role of chemical engineer in industries.
- f) Explain the working of rotameter with neat sketch.

3. Attempt **any four** of the following:

16

- a) Define:
 - i) Atomic weight
 - ii) Molecular weight
 - iii) gm atom
 - iv) gm mole.
- b) Explain any one of the fluid handling equipment.
- c) Give the physical properties of sulphuric acid.
- d) Write and explain nitration reactions of phenol.
- e) Draw the process flow sheet for manufacturing of nitric acid.
- f) Give the reasons for carrying out size reduction operation (any four).

4. Attempt **any four** of the following:

16

- a) Draw the neat diagram of Redwood viscometer.
- b) A gas mixture contains 9 kg H₂, 17 Kg NH₃ and 42 kg N₂ at 343°K and 200 kPa pressure. Calculate partial pressure of each component.
- c) State:
 - i) Dalton's law
 - ii) Amagat's law.
- d) Explain the unit operation used to separate components of gas mixture depending upon the difference in solubilities of component in given solvent.
- e) Explain size separation by screening.
- f) Draw the process flow sheet for manufacturing of sulphuric acid.

J•	Aucingtai	iy ivui (or urc	10110	WILLE

16

- a) Explain different modes of heat transfer.
- b) Solution is prepared by addition of 10 kg of NaOH in 100 kg of water. Calculate weight percentage and mole percentage of a given solution.
- c) Explain drying operation. Draw its symbol.
- d) Explain in brief esterification with suitable example.
- e) With neat diagram, explain the working of U-tube monometer.
- f) Explain the nature of industries based on investment.

6. Attempt **any four** of the following:

16

- a) Convert a pressure of 800 mm of Hg to following units.
 - i) kPa
 - ii) atm.
- b) 20 gm of NaOH is dissolved in water to prepare 500 ml of solution. Find normality and molarity of solution.
- c) Name the unit operation used to separate liquid-liquid mixture by thermal energy. Explain that unit operation.
- d) Differentiate between conversion and yield (any four points).
- e) Write the procedure to measure density of liquid by specific gravity bottle.
- f) Name any four personal protective devices. Give their uses.
